Ideation Phase
Empathize & Discover

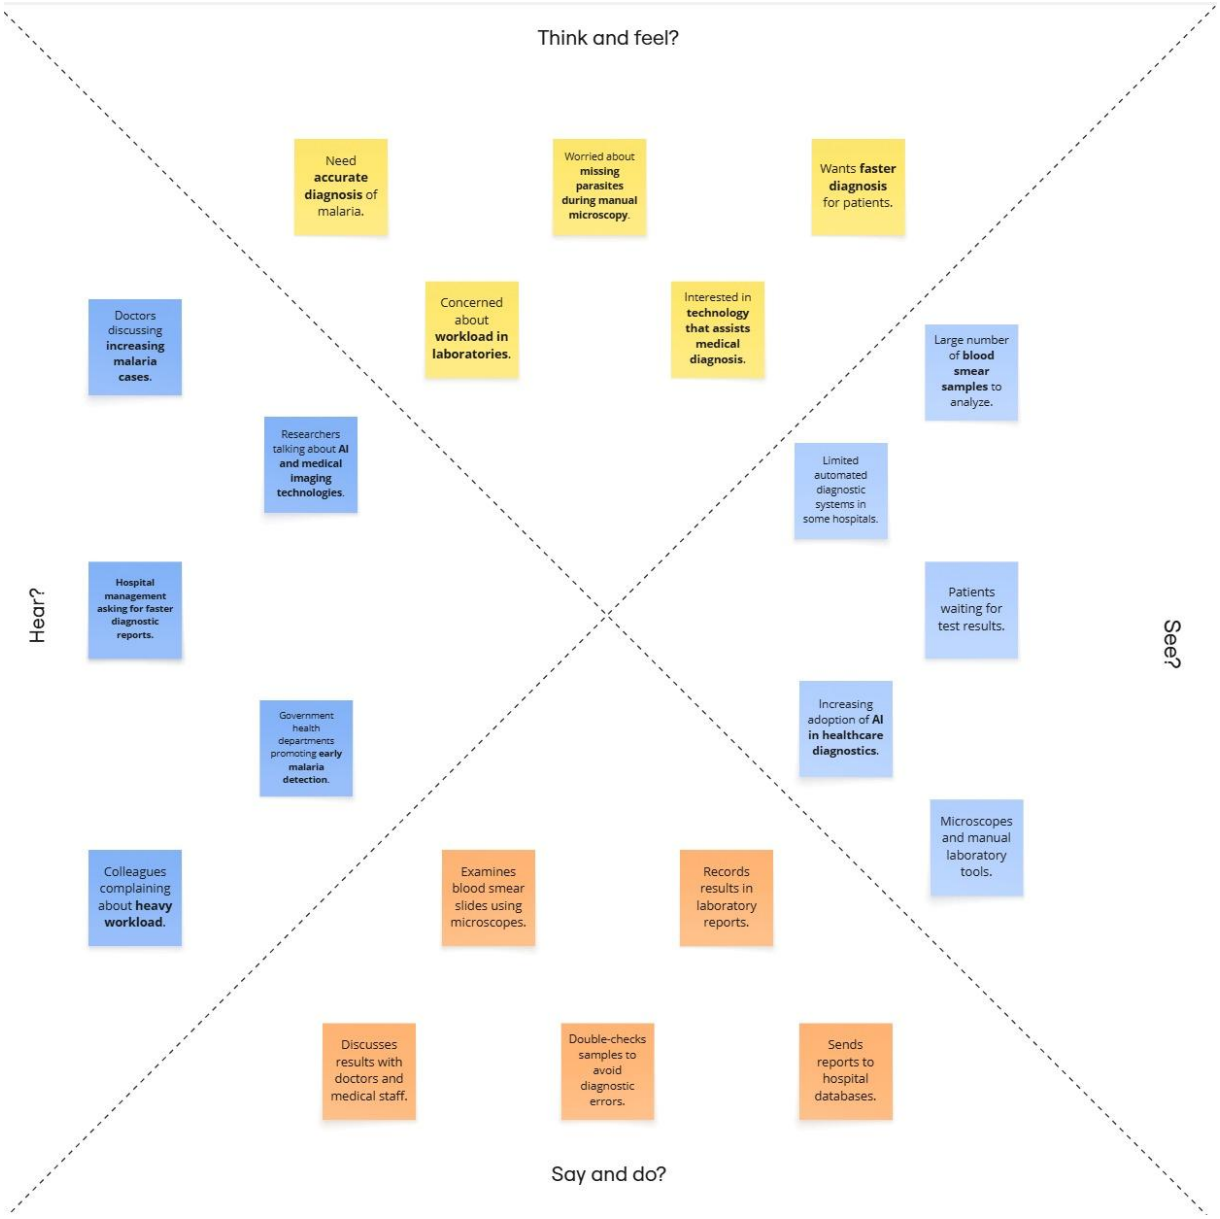
Date	09 March 2026
Team ID	
Project Name	Malaria Detection using Deep Learning
Maximum Marks	4 Marks

Empathy Map Canvas

An Empathy Map is a visual tool used in the Design Thinking process to better understand the needs, thoughts, behaviours, and emotions of users. It helps teams analyse a user's perspective by organizing information into key sections such as Think & Feel, See, Hear, Say & Do, Pain, and Gain. By focusing on the user’s experiences, the empathy map allows designers and developers to identify the real problems users face and the motivations behind their actions.

The primary purpose of an empathy map is to develop empathy for the user, ensuring that solutions are designed based on real user needs rather than assumptions. It encourages teams to consider the user's environment, challenges, frustrations, and expectations when creating a product or service.

In the context of healthcare applications such as AI-based malaria detection systems, an empathy map helps understand the perspective of doctors, lab technicians, and healthcare workers who diagnose malaria using blood smear images. By analysing their workflow, challenges, and goals, developers can design systems that improve diagnostic efficiency, reduce workload, and support faster and more accurate medical decisions.



Think and feel?
Need **accurate diagnosis** of malaria.
Worried about **missing parasites during manual microscopy**.
Wants **faster diagnosis** for patients.
Concerned about **workload in laboratories**.
Interested in **technology that assists medical diagnosis**.
Doctors discussing **increasing malaria cases**.
Large number of **blood smear samples** to analyze.
Researchers talking about **AI and medical imaging technologies**.
Limited automated diagnostic systems in some hospitals.
Hear?
Hospital management asking for faster diagnostic reports.
Patients waiting for test results.
See?
Government health departments promoting **early malaria detection**.
Increasing adoption of **AI in healthcare diagnostics**.
Microscopes and manual laboratory tools.
Colleagues complaining about **heavy workload**.
Examines blood smear slides using microscopes.
Records results in laboratory reports.
Discusses results with doctors and medical staff.
Double-checks samples to avoid diagnostic errors.
Sends reports to hospital databases.
Say and do?
